(a) fixed number of sweeps
(b) residual-based stopping
(c) order between adjacent step sizes
(d) iterations needed to stop
slope 2
slope 1
time step τ
observed order
inner iterations per step (mean)
exact solve: Newton, $\|\mathcal{R}_n\|_{\mathcal{B}} \le 10^{-12}$
fixed $K=6$, $\omega=1$ (original code)
Armijo + (T_A), $c_R=0.1$
fixed $K=1$, $\omega=1/2$
$\omega=1/2$ + (T_A), $c_R=1$
